The COVID-19 pandemic has had a devastating impact on the world. Millions of people have died, and the global economy has been crippled. Where did this pandemic come from? How did it start? These are questions that scientists are still trying to answer.

In his new book, "Where The Pandemic Started," Santosh Kalwar takes a comprehensive look at the origins of COVID-19. He examines the evidence from China, where the virus was first identified, and from around the world. He also discusses the theories about how the virus came to be, including the possibility that it escaped from a laboratory.

Kalwar's book is a must-read for anyone who wants to understand the origins of the COVID-19 pandemic. It is a well-written and informative book

that provides a clear and concise overview of the latest scientific evidence.

Key Findings

- The virus that causes COVID-19 is a novel coronavirus, which means that it is a new type of virus that has not been seen before.
- The virus was first identified in the Chinese city of Wuhan in December 2019.
- The virus has since spread to more than 200 countries and territories, and has caused a global pandemic.
- The COVID-19 pandemic has had a devastating impact on the global economy, and has led to a sharp decline in global economic growth.
- The origins of the COVID-19 pandemic are still unknown, but there are a number of theories about how the virus came to be.

Theories About the Origins of COVID-19

There are a number of theories about how the COVID-19 pandemic started. One theory is that the virus escaped from a laboratory in Wuhan. Another theory is that the virus originated in bats and was transmitted to humans through an intermediary animal. A third theory is that the virus originated in pangolins and was transmitted to humans through an intermediary animal.

There is no definitive evidence to support any of these theories. However, the scientific consensus is that the virus most likely originated in bats and was transmitted to humans through an intermediary animal.
